#### Introduction

· Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

- · Problems you want to find answers
  - What factors determine if the rocket will land successfully?
  - The interaction amongst various features that determine the success rate of a successful landing.
  - What operating conditions needs to be in place to ensure a successful landing program.

4

### Methodology

#### **Executive Summary**

- Data collection methodology:
  - Data was collected using SpaceX API and web scraping from Wikipedia.
- · Perform data wrangling
  - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - How to build, tune, evaluate classification models

6

#### **Data Collection**

- The data was collected using various methods
  - Data collection was done using get request to the SpaceX API.
  - Next, we decoded the response content as a Json using .json() function call and turn it into a pandas dataframe using .json\_normalize().
  - We then cleaned the data, checked for missing values and fill in missing values where necessary.
  - In addition, we performed web scraping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
  - The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

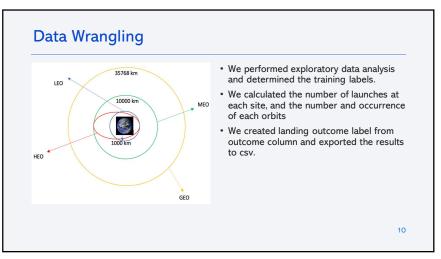

/

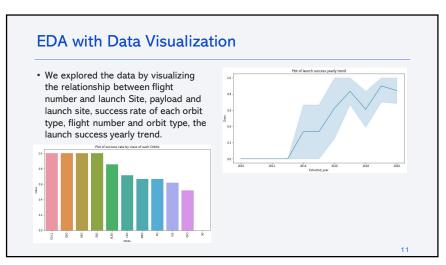

8

#### Data Collection - SpaceX API

 We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.

#### **EDA** with SQL

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
  - The names of unique launch sites in the space mission.
  - The total payload mass carried by boosters launched by NASA (CRS)
  - The average payload mass carried by booster version F9 v1.1
  - The total number of successful and failure mission outcomes
  - The failed landing outcomes in drone ship, their booster version and launch site names.

12

#### Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
  - Are launch sites near railways, highways and coastlines.
  - Do launch sites keep certain distance away from cities.

13

14

#### Build a Dashboard with Plotly Dash

- · We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

14

#### Predictive Analysis (Classification)

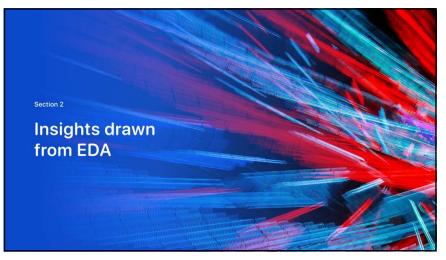

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.

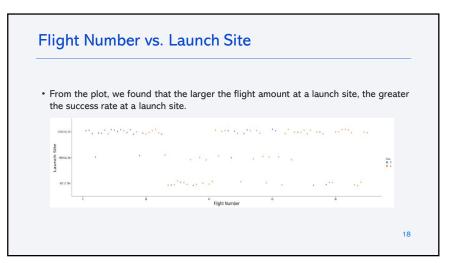

15

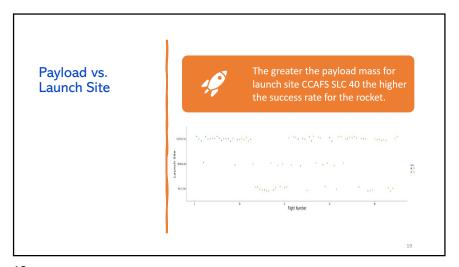

#### Results

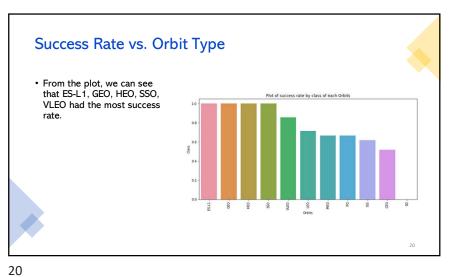

- Exploratory data analysis results
- · Interactive analytics demo in screenshots
- Predictive analysis results

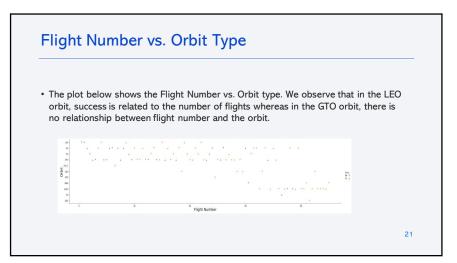

16

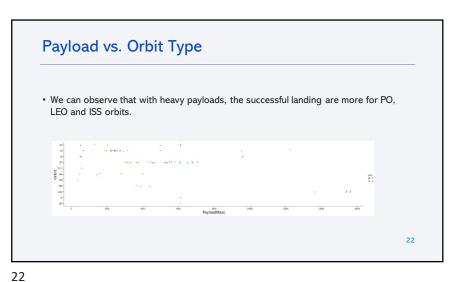

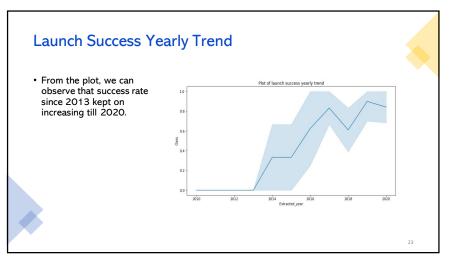

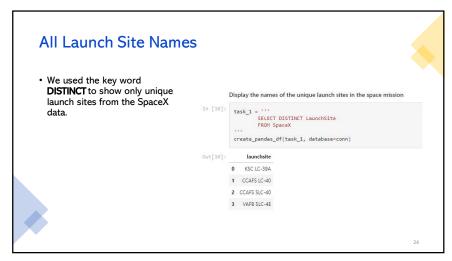

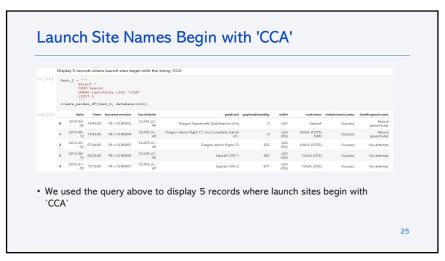

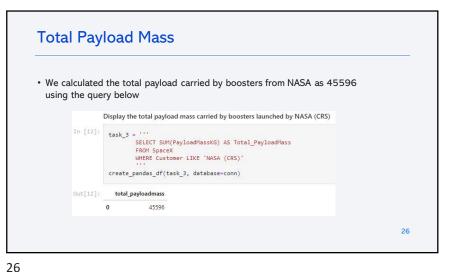

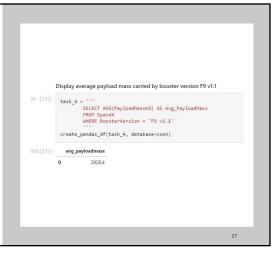

### Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

### First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22<sup>nd</sup> December 2015

In [14]:

task\_5 = ''

SELECT MIN(Date) A5 FirstSuccessfull\_landing\_date
FROM SpaceX
WHERE LandingOutcome LIKE 'Success (ground pad)'

create\_pandas\_df(task\_5, database=conn)

Out[14]:

firstsuccessfull\_landing\_date

0 2015-12-22

# Successful Drone Ship Landing with Payload between 4000 and 6000

In [15]:

task\_6 = ''

SELECT BoosterVersion
FROM SpaceX
WHERE LandingDutcome = 'Success (drone ship)'
AND PayloadMassKG > 4000
AND PayloadMassKG > 6000

create\_pandas\_df(task\_6, database\*conn)

0 F9 FT B1022

F9 FT B1026
 F9 FT B1021.2
 F9 FT B1031.2

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

## Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

In [16]:

task\_7a = ...

SELECT COUNT(PlissionOutcome) A5 SuccessOutcome
FROD SpaceC

MORER PlissionOutcome LIKE 'SuccessOutcome
FROD SpaceC

Lask\_7b = ...

SELECT COUNT(PlissionOutcome) A5 FailureOutcome

FROD SpaceC

Lask\_7b = ...

SELECT COUNT(PlissionOutcome) A5 FailureOutcome
FROD SpaceC

Lask\_7b = ...

30

 We used wildcard like '%' to filter for **WHERE** MissionOutcome was a success or a failure.

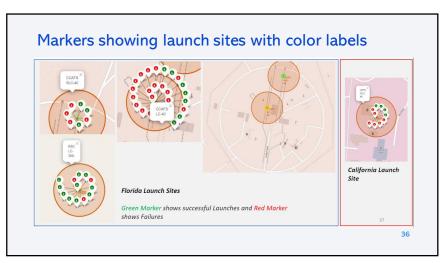

#### **Boosters Carried** In [17]: task\_l = .... SEECT ResisterVersion, PayloadhassKG FROM SpaceX MHERE PayloadhassKG = SELECT MAX(PayloadhassKG) FROM SpaceX ) Maximum Payload · We determined the booster that have carried the maximum create\_pandas\_df(task\_8, database=conn) payload using a subquery in the **WHERE** clause and the **MAX()** 0 F9 B5 B1048.4 1 F9 B5 B1048.5 15600 2 F9 B5 B1049.4 3 F9 85 B1049.5 15600 4 F9 B5 B1049.7 5 F9 B5 B1051.3 15600 6 F9 B5 B1051.4 7 F9 B5 B1051.6 8 F9 B5 B1056.4 9 F9 B5 B1058.3 15600 10 F9 B5 B1060.2 11 F9 B5 B1060.3 15600

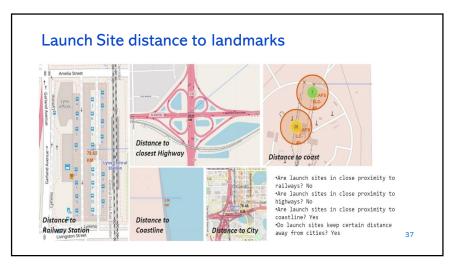

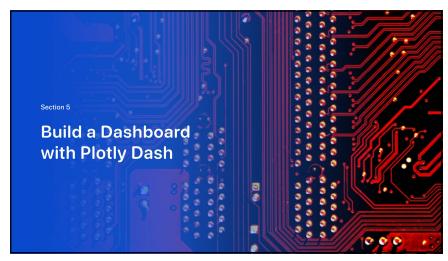

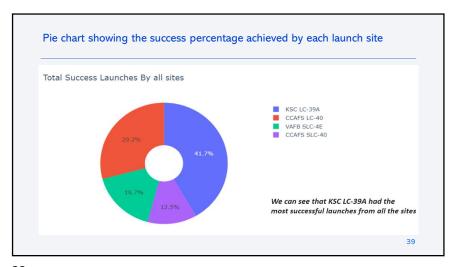

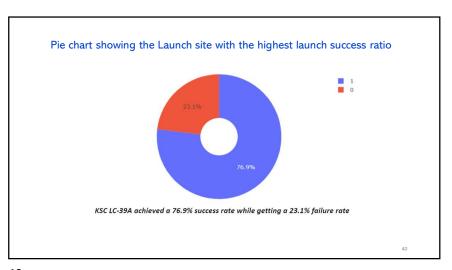

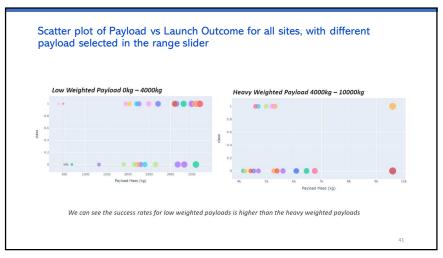

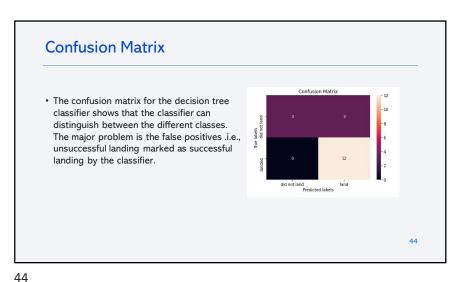

#### Conclusions

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- $\bullet$  The Decision tree classifier is the best machine learning algorithm for this task.
